Active Ingredient : Botulinum toxin type A
Manufacturing Company: Allergan

Active Substance: Botulinum Toxin

Pharmacological effect

This drug is also named botulinum toxin type A. Botox is formed from bacteria which produces botulism. This toxin blockades the nervousness in the muscles.

Usage:

Botox is used in therapy of cervical dystonia, muscle convulsions, blepharospasm. It also prevents facial wrinkles, chronically migraine. This medication also treats hyperhidrosis (serious axillary sweating). It cures the pathology of eyelids muscles when the eyes don't look in the same direction.

After effect:

People being treated with Botox may occur unwanted effects. These effects include muscle fragility that are injected, bleeding, fatigue, higher sense of light, worse feeling of migraine or worsening of headache. Contact emergency if you have problem with vision, random heartbeats, complications with breathing, urinary infection, higher sweating or you lost the bladder control.

How to administer (optionally):

Botox is injected into the muscles. The maximum dose should not be higher than 400 Units in 3 months. You may use the injection into more than one area. It has to pass more than 2 weeks after the injection after the syndromes advance.
